Antulov Jasenka

# Case 1

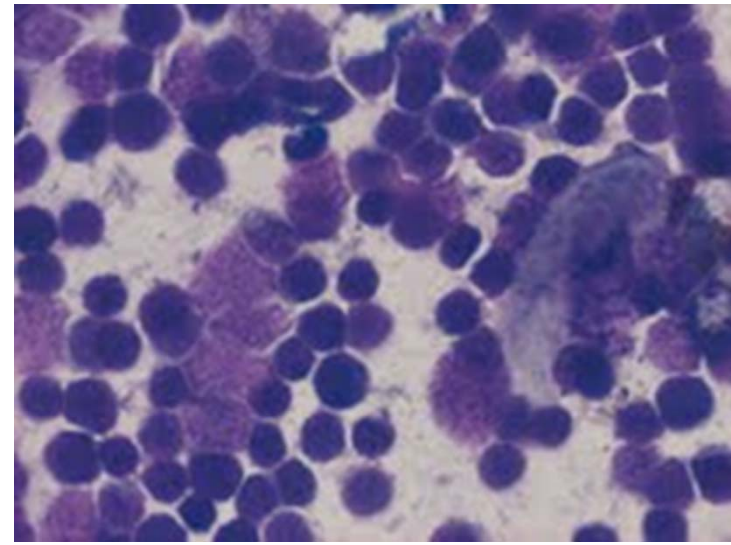

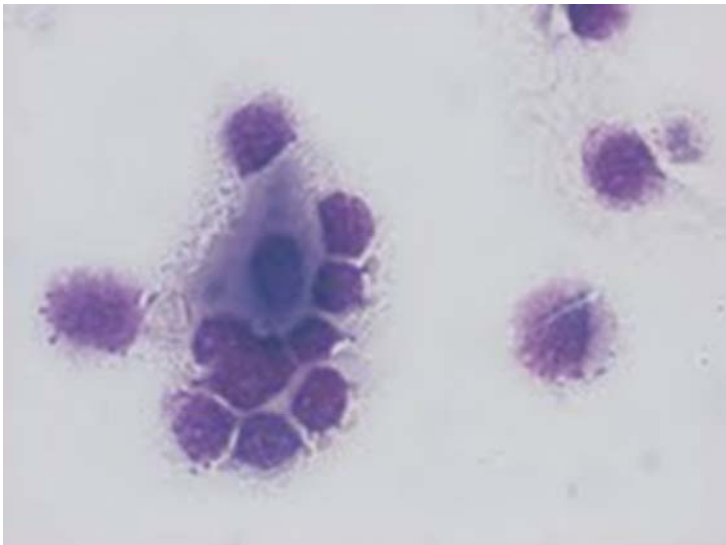

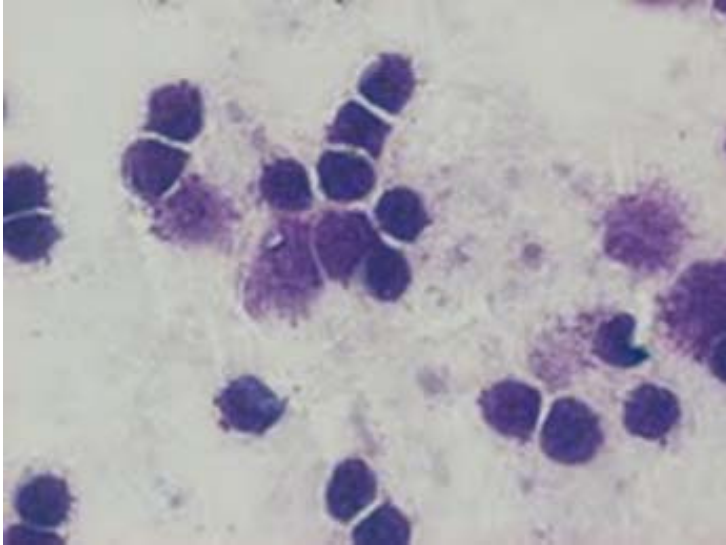

A 62-year-old man with a history of mantle cell lymphoma was admitted to the hospital because of back pain spreading around the waist.

He had previously received multiple lines of chemotherapy.

**MSCT** of the thorax, abdomen and pelvis was performed, revealing a big expansive formation measuring 18 x 10 cm in which the bladder is embedded. The infiltrative process was extending along the distal part of the right ureter and along the entire left ureter up to the pyelon. Enlarged lymph nodes of the upper anterior mediastinum and the retroperitoneal lumbar region were detected.

Ultrasonography revealed bilateral dilatation of a canal system with the dilated renal pelvis.

By catheterization only 30 ml of urine was obtained.

## Case 2

A 55-year-old man was admitted to the hospital because of back pain irradiating into both legs.

MSCT of the abdomen and pelvis revealed an infiltrating process of the right iliac bone and fifth lumbar vertebrae. Bilateral iliac bone marrow, fifth lumbar vertebrae trephine, and FNA biopsies were performed.

Bilateral iliac bone marrow, fifth lumbar vertebrae trephine, and FNA biopsies were performed.
